

Interservices Factory

The Software Factory Line at **Interservices** offers Remote Development Services as well as corrective and evolutive maintenance of applications, which enable us to implement continuous improvement processes.

INTERSERVICES Factory

The Software Factory Processes offered by **Interservices** involve a proven mature Methodology to facilitate the control and management of all intrinsic activities. All products are of the highest quality, which is evidenced by the fact that we have more than 20 products completed and over 200,000 man-hours of development.

All of our Customers are highly satisfied with the services we offer, not only because of the marked, tangible reduction in the cost of their projects (which translates into a lower TCO), but also because they obtain greater predictability in the Project Plan. In addition, Customers minimize the operative risk and infrastructure margins involved in on-site software deployment.

Interservices Factory offers a work method that allows for reasonable, specific estimate of resources, costs and scheduling. These estimates are updated regularly as the project progresses, which results in a fast-growing interdependence of the different Software elements.

Thus, between the Software and the Project, we create an environment that is both clear and comprehensible for Executives and Technicians.

At our offices in the city of Buenos Aires, we have an experienced group of professionals and a set of rules, principles and classifications that have facilitated the successful development of applications in countries of South America as well as Europe and North America.
